

5nine Manager 6.0 for Hyper-V

What's New in v6.0

5nine Manager for Hyper-V is an easy-to-use and cost-effective management solution for Microsoft Hyper-V. It provides most of the features of Microsoft System Center VMM that you need for everyday Hyper-V management.

The latest version is now powered up with several disruptive innovation product enhancements, such as Dynamic Optimization and New FreeRDP version integration. 5nine Manager for Hyper-V will allow system administrators to gain control on all levels over the virtual infrastructure and virtual resources utilization.

The most significant features and enhancements in version 6.0 include:

Dynamic Optimization

With 5nine Manager 6.0 for Hyper-V, stay confident that your mission-critical application will always operate full-time. Dynamic Optimization evaluates the current state of each host on your Hyper-V Server. It automatically moves Virtual Machines from one host to another based on resource utilization, regardless of how many hosts are involved.

This approach allows system administrators to optimize all resources within the network and avoid the overload and shutdown of its hosts. Each host runs on the optimal level of capacity, thereby decreasing the resource usage and the importance for continuous system monitoring.

"5nine Manager makes those who do not wish to use SCVMM easier with managing multiple VM host versions from a single console."

GUI on Every Hyper-V Server

In this new version of 5nine Manager for Hyper-V, 5nine Software includes an enhanced FreeRDP connection view to connect from core Hyper-V servers as efficiently as from the GUI ones. Enjoy the freedom of connecting to Virtual Machines in any number of ways.

New FreeRDP Guest Console integration will meet the customers' requirements in a stable additional way to access and configure their Virtual Machines.
